

Case Study

Spring Recoil Hose Reels are an easy solution to keep work areas clear and to ensure exhaust gases are expelled from the working environment.

The extraction hose is manually wound onto the overhead reel for safe storage until required by an operator. The internal locking mechanism allows the hose to be freed from the reel for connection to a vehicle exhaust pipe.

All types of exhaust pipe can be accommodated by the addition of a “Y piece” or individually moulded capture funnel.

An automatic on/off fan switch is optional to allow efficient energy consumption when the reels are not in use.
