

Case Study

Our Company was approached by an Engineering Company who required an extraction solution for two plasma cutting machines that were being extended on the site.

The heavy industry building had a number of obstacles to overcome however we were able to design and install a bespoke extraction system that could fulfil all requirements on site.

After our design process had calculated the correct solutions ductwork was installed on site from the system into the building. Then a final connection was made to the two plasma cutting machines.

The final installation also included 10 inspection hatches along the duct run to enable ongoing maintenance on site.

The installation has enable increased production and capabilities on site. As a result a number of other bespoke solutions have been installed on the site.
