

Case Study

We received an enquiry from an existing customer who has multiple processes being used on site, asking our Company to provide a solution for an enclosed space.

The operatives in the space are engage in polymer mixing in various vessels.

Our solution was to create a ducted canopy system which was able to be kept out of the operating space of the staff.

As part of our solution strip curtain was used to enclose the area and provide maximum extraction and ensure there was no escape of fumes.

A ducting attenuator was installed to ensure that where possible there was a reduction in noise level within the system.

Our customer is very happy with the design and effectiveness of the capture, and we continue to provide solutions as required on site.
