

Case Study

Our Company was approached by the world's largest luxury jet tender provider to provide a workshop solution for the workshop dust problems on site.

After liaising with the client it was decided that a fixed Dust Extraction System would be suitable for the three existing workshop machines requiring extraction and the four new six metre arms that would be installed to provide further localised extraction. The arms have full manoeuvrability over the working areas to ensure worker protection and no loss of working area.

The fixed Dust Extraction System was installed externally to the building to keep the working areas free.

The system comprises a fully automatic cleaning mechanism, served by a control panel which is activated upon shutdown to reduce maintenance and quick release bins to enable simple disposal of collected dust.

Our customer is very happy with the design and effectiveness of the capture, and this has helped to increase productivity on site.
