

## Case Study

---

We were asked to engineer a solution for a food manufacturing facility within their dry ingredients area, as a requirement had been highlighted to protect employees during weighing and storage of spices and herbs.

Our solution was to site an ATEX rated dust extraction unit externally within a small area of space available and connect this to food grade stainless steel ducting. Internally ATEX food grade extraction arms were utilised to provide protection of workers over a wide work area whilst slitting and tipping.

The solution matched and exceeds the client brief and has led to additional systems being installed on site.
