

## Case Study

---

An existing LEV test customer asked our Company to design and install a new wood dust extraction system for their new factory.

The client was moving to expand their production capability to a much larger scale and wanted a turnkey solution. Our in house electrician helped to make sure that everything run smoothly.

The extraction system was to encompass a number of CNC's, beam saws, edgebanders, sanders and chop saws used to manufacture fitted furniture.

Our modular extraction unit was able to fulfil the requirement and also provide scope for future expansion.

Wood dust is a major cause of occupational asthma and other more serious illnesses.

The HSE are actively pursuing Companies in the woodworking sectors and having a well designed LEV system protecting your workers will help to fulfil your obligations under COSHH Regulations.
