

Case Study

The customer is a major manufacturer of shunting tractors, terminal tractors, aviation tractors and specialist vehicles. As part of their expansion in the U.K market a brand new purpose built service centre which incorporates state of the art workshops required Vehicle Exhaust Extraction.

Our solution was to work with the customer to place Motorized Vehicle Exhaust Extraction Reels at each point where an operative would be performing maintenance on a vehicle.

The reel carries the required length of hose on a steel drum and is fixed at a high level to keep the vehicle workshop free from obstruction and trips hazards, a benefit which improves health and safety in the workplace.

Remote controls can be infra-red or pendant type or fitted to the workshop walls to allow for easy operation when the equipment is required.
